LSEG

Execution Policy Intelligence

Turning FX execution analytics into evidence-backed execution policy management

Product proposal for leadership review | October 2026 | Seeking approval to validate

THE PROBLEM

We can analyse execution. But can we continuously prove that our execution policies still work?

WHAT WE HAVE TODAY

Execution data | **TCA** | **Analytics**

?

WHAT IS MISSING

Policy | **Evidence** | **Review** | **Decision** | **Memory**

The gap. Policies are set from evidence at a point in time. Months later, the evidence is scattered across TCA outputs, quant notebooks, spreadsheets and committee minutes, and hard to demonstrate on demand.

HERO EXAMPLE

A real-world policy: EP-427

EP-427

For EUR/USD forwards above $50M under high-volatility conditions, use Algo B.

Instrument	Order size	Market condition	Execution method
EUR/USD Forward	**> $50M**	**High volatility**	**Algo B**

ORIGINAL VALIDATION | March 2026 — **SUPPORTED**

+0.72 bps
execution improvement

1,246
comparable trades
Threshold: +0.25 bps

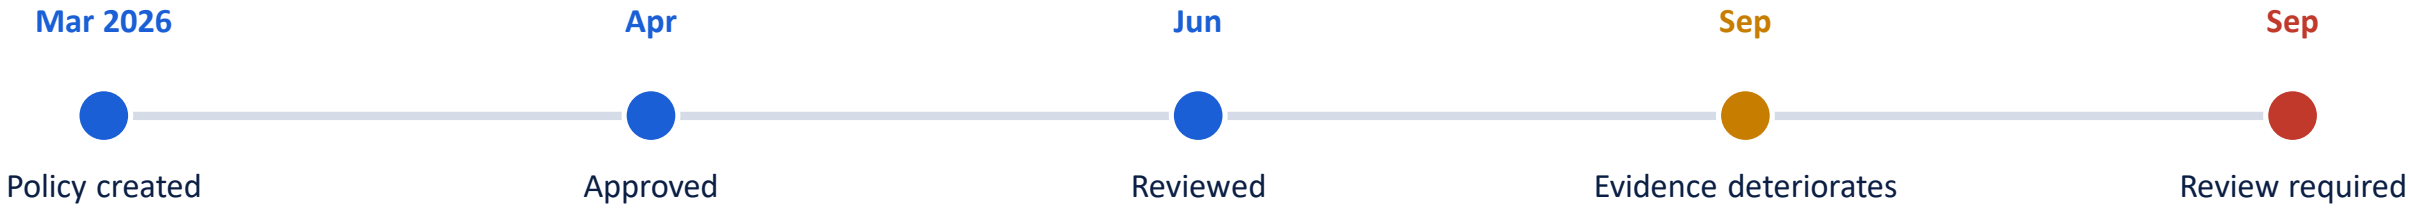

CURRENT EVIDENCE | September 2026 — **REVIEW REQUIRED**

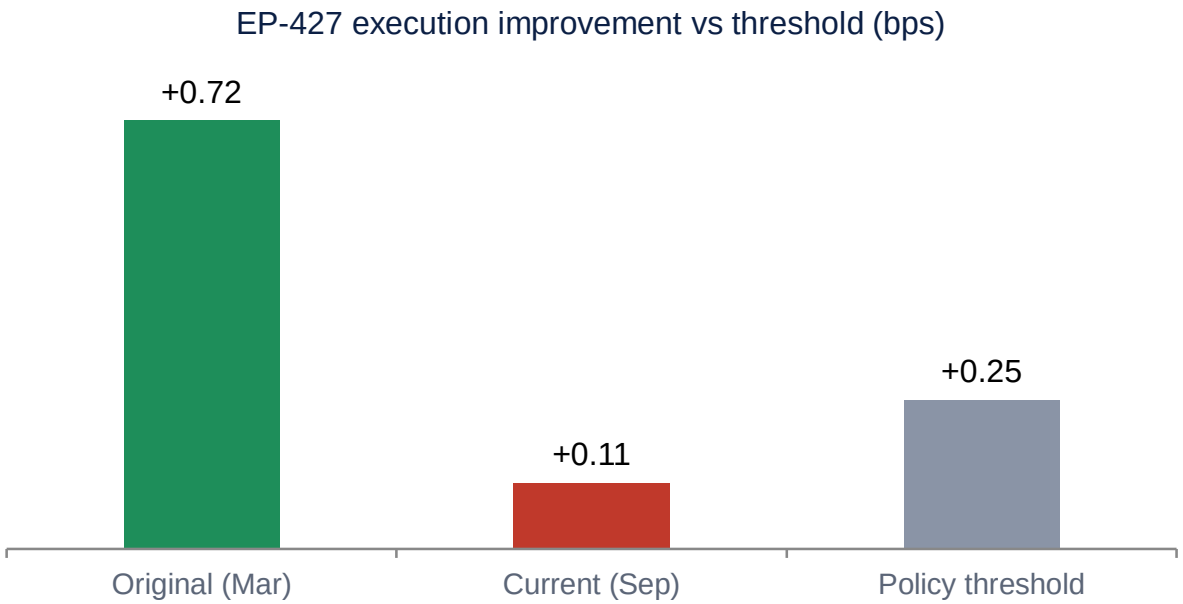

+0.11 bps
execution improvement

3,100
comparable trades
Threshold: +0.25 bps

POLICY LIFECYCLE

What happens over time? The evidence moves, and the record does not

Without a persistent policy layer

- Evidence lives in TCA exports, notebooks and slide decks
- Thresholds and rationale are hard to retrieve later
- Review timing depends on people remembering
- Decisions and reasons are not linked to evidence

THE PROPOSAL

The proposed product: an Execution Policy Register, powered by Tradefeedr evidence

Policy Review Center | Policy status | AI evidence explanation | Human decision workflow

EXECUTION POLICY REGISTER

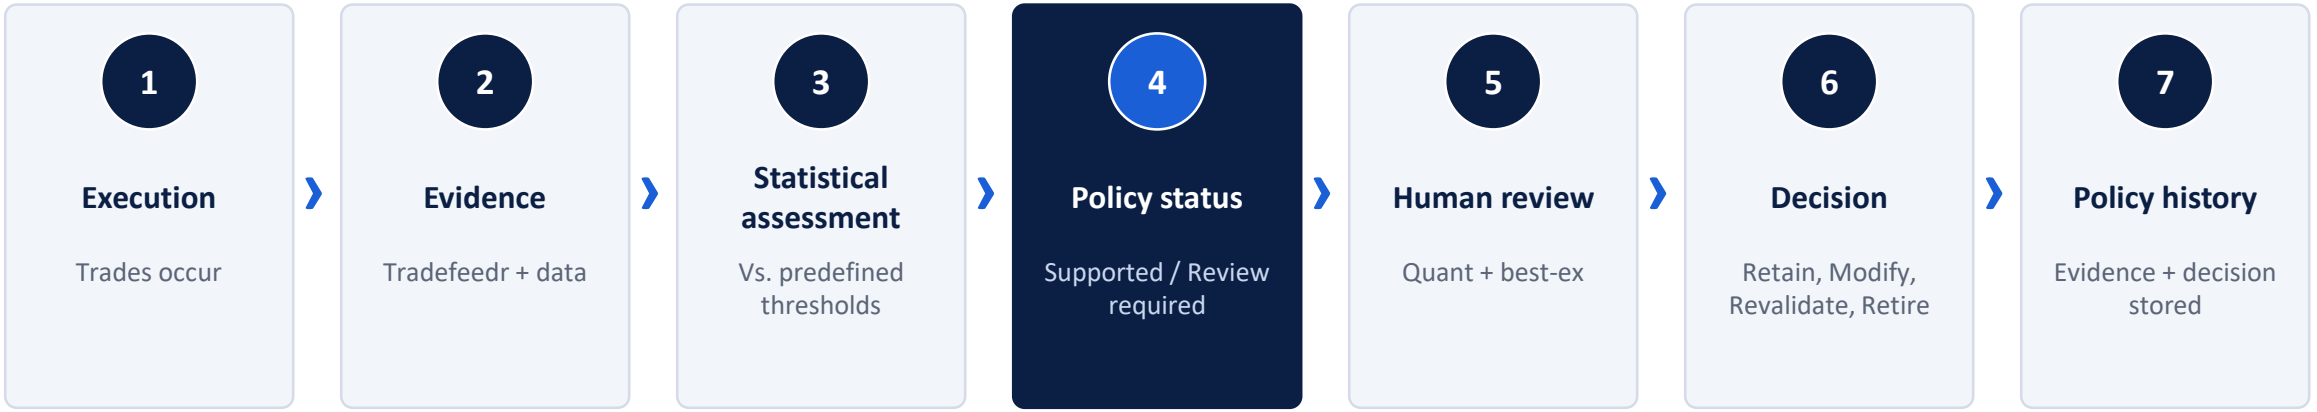

What policies exist	Why created	Supporting evidence	Review triggers	Decisions + history

Evidence integration layer ← LSEG Tradefeedr analytics, execution data, existing experiment / algo-wheel results

Not a TCA dashboard | Not an autonomous trader | Not an algo selector | Not a chatbot | Not new experiment infrastructure

WORKFLOW

How it works: evidence is maintained in the background; humans act at review points

Policy revalidated over time. Each decision restarts the evidence cycle, building an institutional memory of why execution policies were kept, changed or retired.

WHERE AI FITS

Statistics determine. AI explains. Human decides.

STATISTICS DETERMINE

Deterministic engine checks evidence against predefined policy thresholds and sets status.

AI EXPLAINS

Explains validated results, supports natural-language investigation and governance notes.

HUMAN DECIDES

Quant and best-ex choose Retain, Modify, Revalidate or Retire. Decision is recorded.

AI does NOT

- Change policies autonomously
- Reallocate algo flow
- Override statistical status

EP-427 | Explain with AI

"The policy has moved into review because its current observed execution improvement (+0.11 bps) is below the effectiveness threshold (+0.25 bps) defined when the policy was established. The evidence supports human review and possible revalidation rather than automatic policy modification."

Revalidate ›

via existing experiment / algo-wheel

COMPETITION

Competitive landscape: strong analytics everywhere; the whitespace is persistent policy-level evidence

Provider	Execution analytics / TCA	Best-ex governance & reporting	Policy-level evidence, lifecycle & provenance
LSEG Tradefeedr	Core strength	Supported	Not the focus today
Bloomberg BTCA	Core strength	Core strength	To validate
FairXchange / 360T	Present	To validate	To validate
Internal bank tooling	Quant analysis, databases	Compliance workflows	Varies; may be built in-house
Proposed: Execution Policy Intelligence	Builds on Tradefeedr	Supports	**Intended focus**

Assessment based on public positioning; competitor capabilities must be verified in discovery. Cells marked "To validate" are open questions, not claimed gaps.

Key commercial question: will institutions build or extend this internally, or prefer a vendor-backed policy-evidence workflow?

STRATEGIC FIT

Why LSEG is well positioned to build this

EXECUTION POLICY INTELLIGENCE | Policy Register | Evidence | Review | History

Tradefeedr

Execution analytics, TCA, algo forecasting

FXall

Execution workflows

Workspace

Desk distribution and embedding

FX data

Market and execution data

Moat is relatively modest. It would come from:

- **Data integration**
- **Workflow integration**
- **Policy history**
- **Institutional adoption**
- **Distribution**
- **Time-to-market**

No claim of an impenetrable moat. AI is an enhancement, not the moat.

TIMING

Why now: regulatory timing gives a concrete beachhead; it does not guarantee demand

Initial beachhead (narrow)

EU-regulated investment firms trading in-scope FX derivatives such as forwards, NDFs and swaps.

Not all institutional FX. Not spot FX under the same requirement.

Market tailwinds

- Increasing execution complexity
- Growth of algorithmic execution
- Fragmented FX liquidity
- Need for ongoing evidence
- Existing LSEG infrastructure

BUSINESS CASE

MVP and business case: a premium Tradefeedr / Workspace capability, to be validated

MVP

Policy Register
Tradefeedr / evidence integration
Statistical threshold monitoring
Policy Review Center and status
AI explanation + natural-language investigation
Human decision workflow
Policy history / provenance
Link to existing revalidation infrastructure

Customer and model

User: FX / eTrading Quant
Stakeholder: Best-Execution / Compliance
Sponsor: Head of FX Trading / eTrading
Segment: EU-regulated desks, in-scope derivatives
Model: premium Tradefeedr / Workspace capability
ROI: to be validated, not assumed

Success metrics

PRIMARY: % of active policies with a current evidence-backed review

Supporting: review completion rate; time to prepare a review; policies flagged for revalidation; quant hours on evidence prep; Tradefeedr retention/expansion; policies with full provenance

KEY ASSUMPTION TO VALIDATE

"Will institutions prefer a vendor-backed policy evidence system over extending existing TCA/compliance tooling?"

RECOMMENDATION

Recommendation: validate before scaling

Risks we are not hiding

- Existing TCA / compliance tooling may be enough
- Customers may prefer internal tools
- Regulatory scope is narrower than all FX
- Bloomberg or others could add similar capability
- ROI not yet quantified
- Technology moat is modest
- AI is an enhancement, not the moat

1. **Customer discovery**
   3-5 target-customer interviews
2. **Prototype / pilot**
   EP-427-style workflow on real policies
3. **Measure**
   Workflow burden and willingness to pay
4. **Decide**
   Scale, adjust or stop

Tradefeedr tells us what happened. Execution Policy Intelligence tells us whether the execution policies we rely on are still supported by evidence.
